Prerequisites:

- Ensure you have XAMPP installed on your computer. You can download XAMPP from [here](#).

Steps:

1. Download the Website Files:

- Download the website files from the source.
- Extract the files to a folder on your computer.

2. Move Website Files to XAMPP's `htdocs` Directory:

- Move the extracted website folder to `C:\xampp\htdocs\`.
- For example, if your website folder is named `alambanafoundation.org`, the path should be `C:\xampp\htdocs\alambanafoundation.org`.

3. Start XAMPP:

- Start XAMPP by running `xampp-control.exe` from your XAMPP installation directory (usually `C:\xampp`).
- Start the Apache server by clicking the "Start" button next to "Apache" in the XAMPP Control Panel.

4. Access the Website:

- Open your web browser.
- Visit `http://localhost/alambanafoundation.org/`.

Now, you should be able to access the `alambanafoundation.org` website locally on your system using XAMPP. Please make sure that the website files are structured correctly within the `alambanafoundation.org` folder inside the `htdocs` directory.
